Inventory system: revision guide

Blue outlines and labels point to the new controls. These screenshots use a disposable test database.

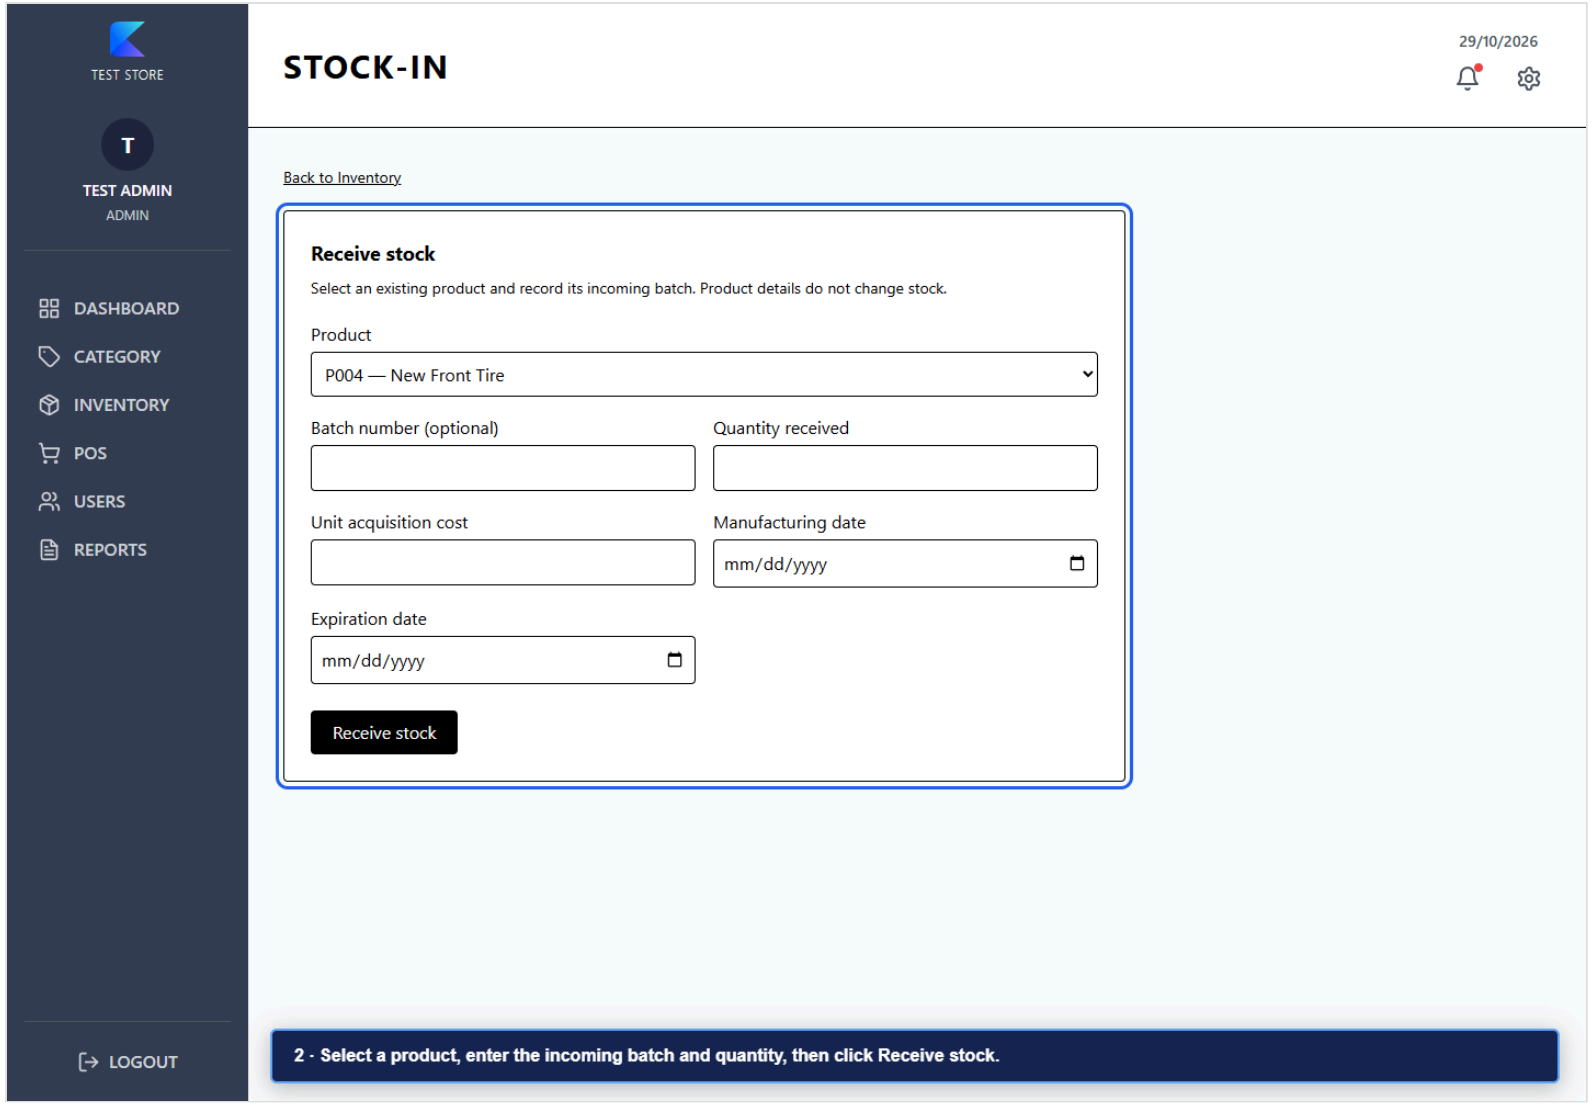

1. Inventory

Product forms no longer change quantities. Click Stock-in to receive products.

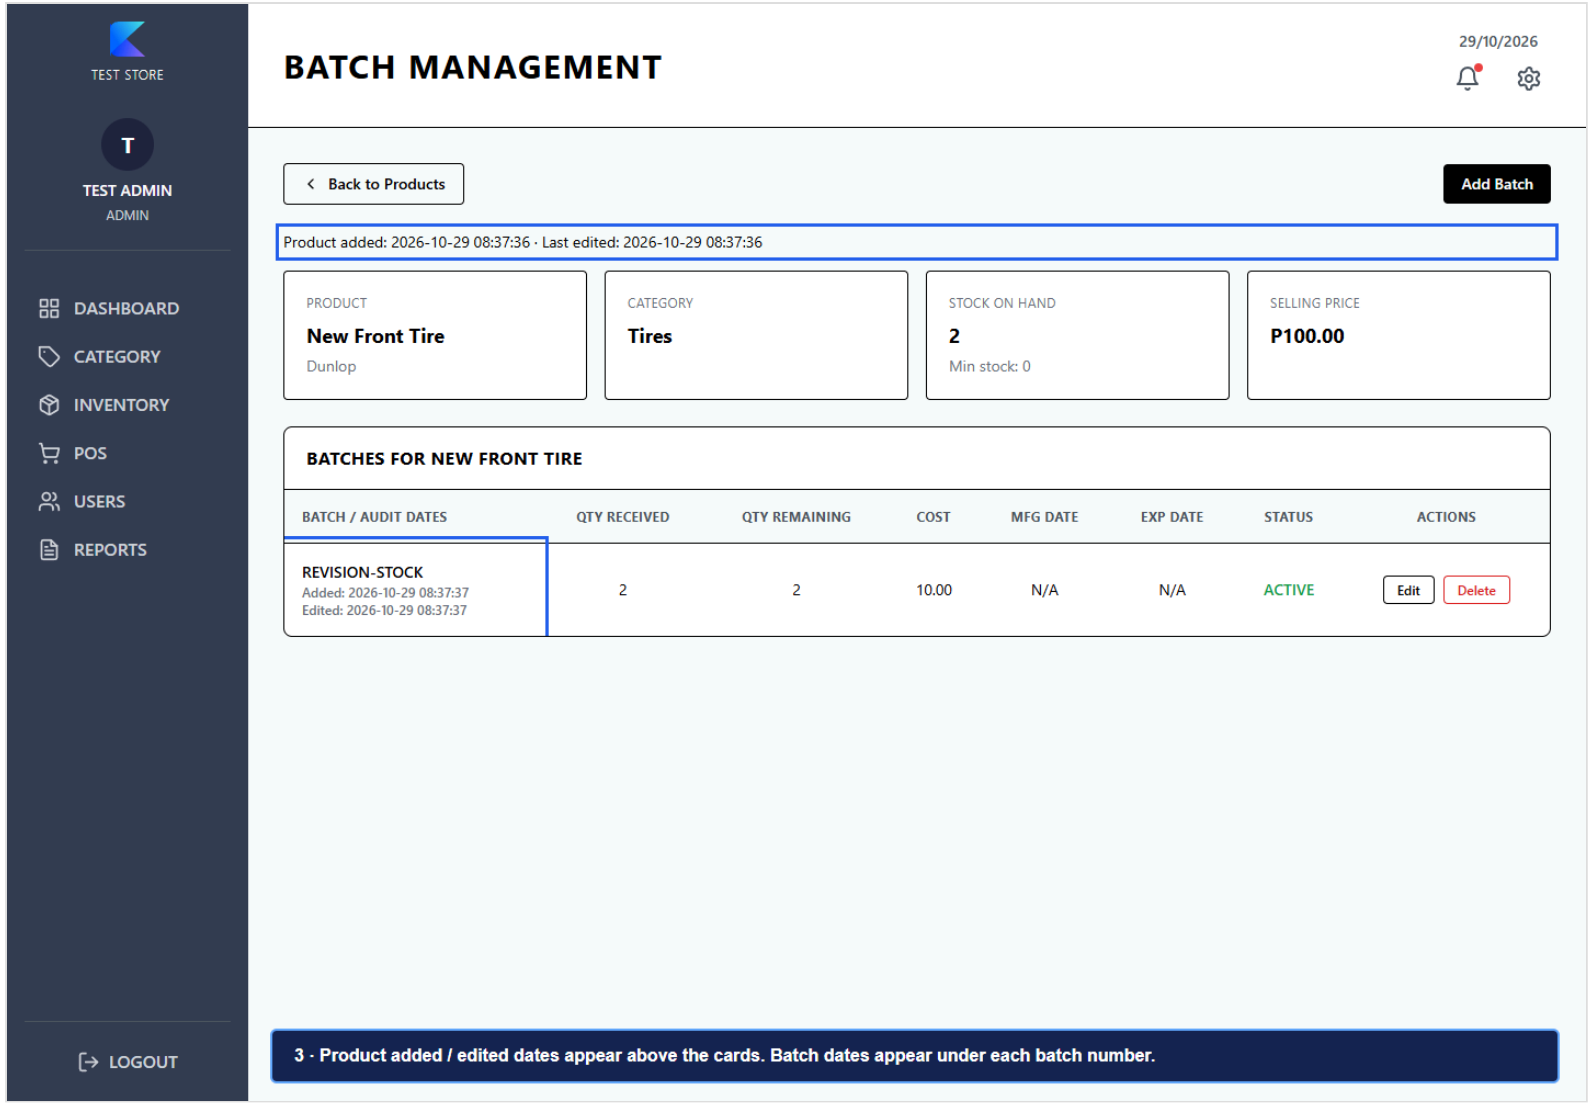

2. Stock-in

Choose an existing product, record its batch and incoming quantity, then receive stock.

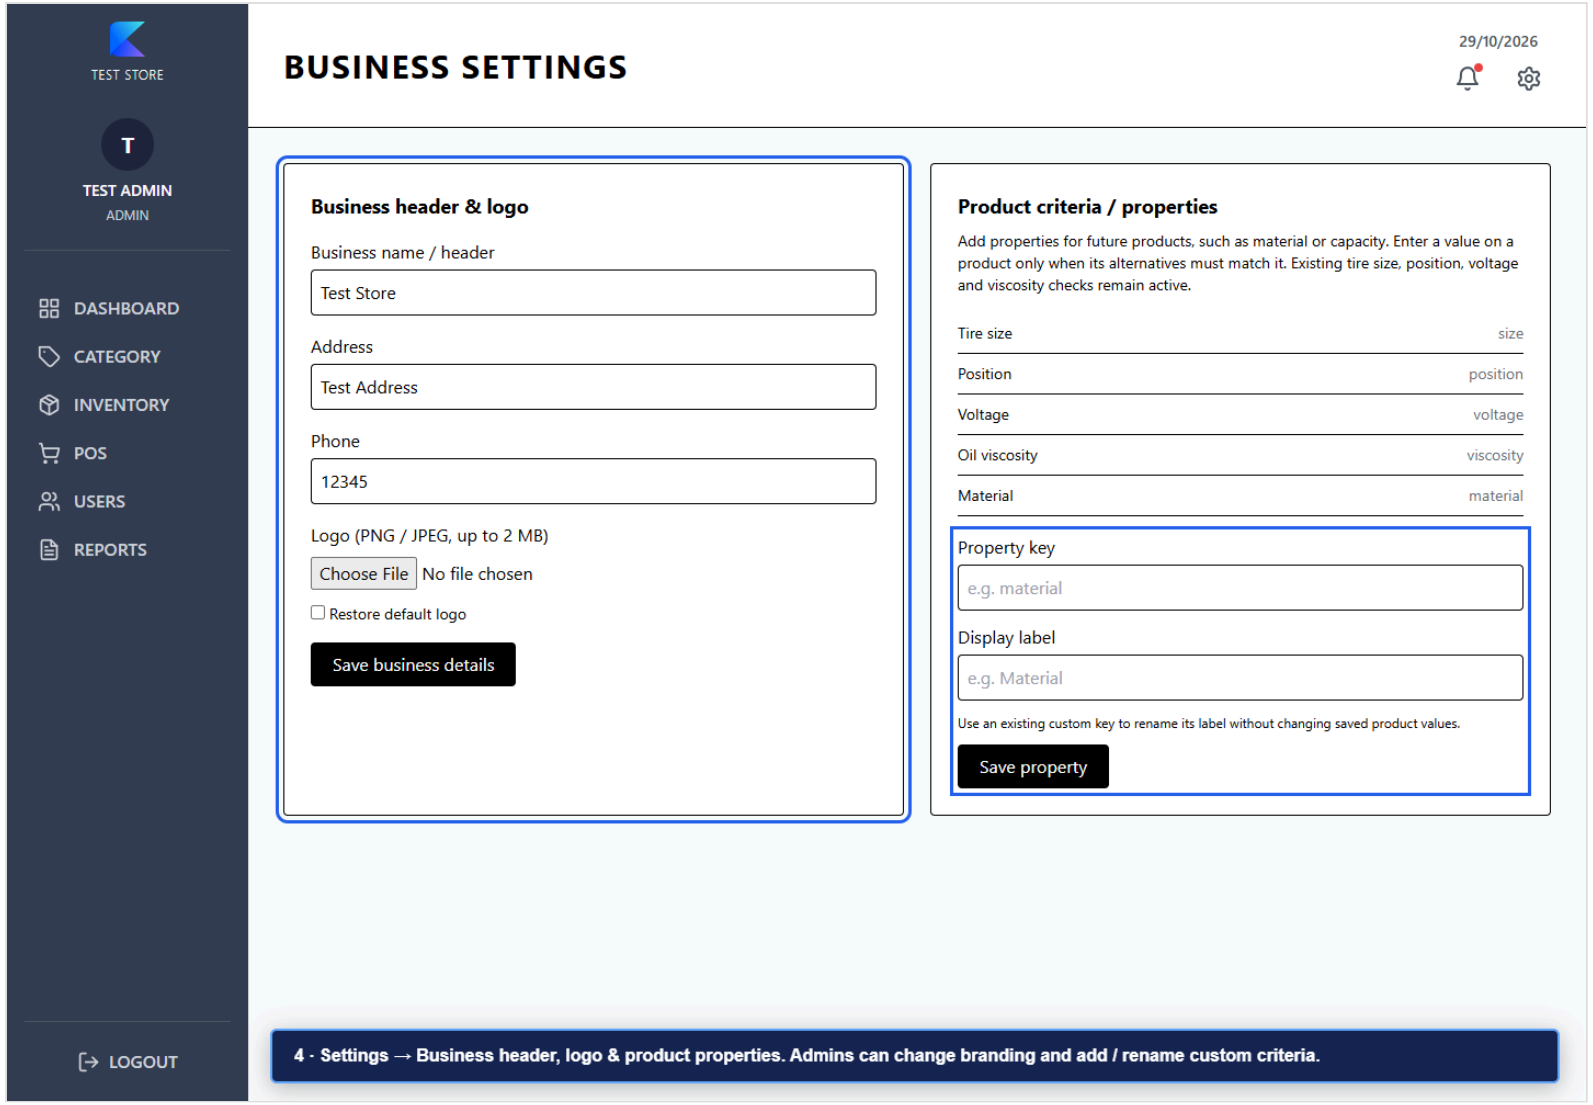

3. Batch dates

See product creation and edit dates and batch creation / update dates. Older unrecorded dates are shown as not recorded.

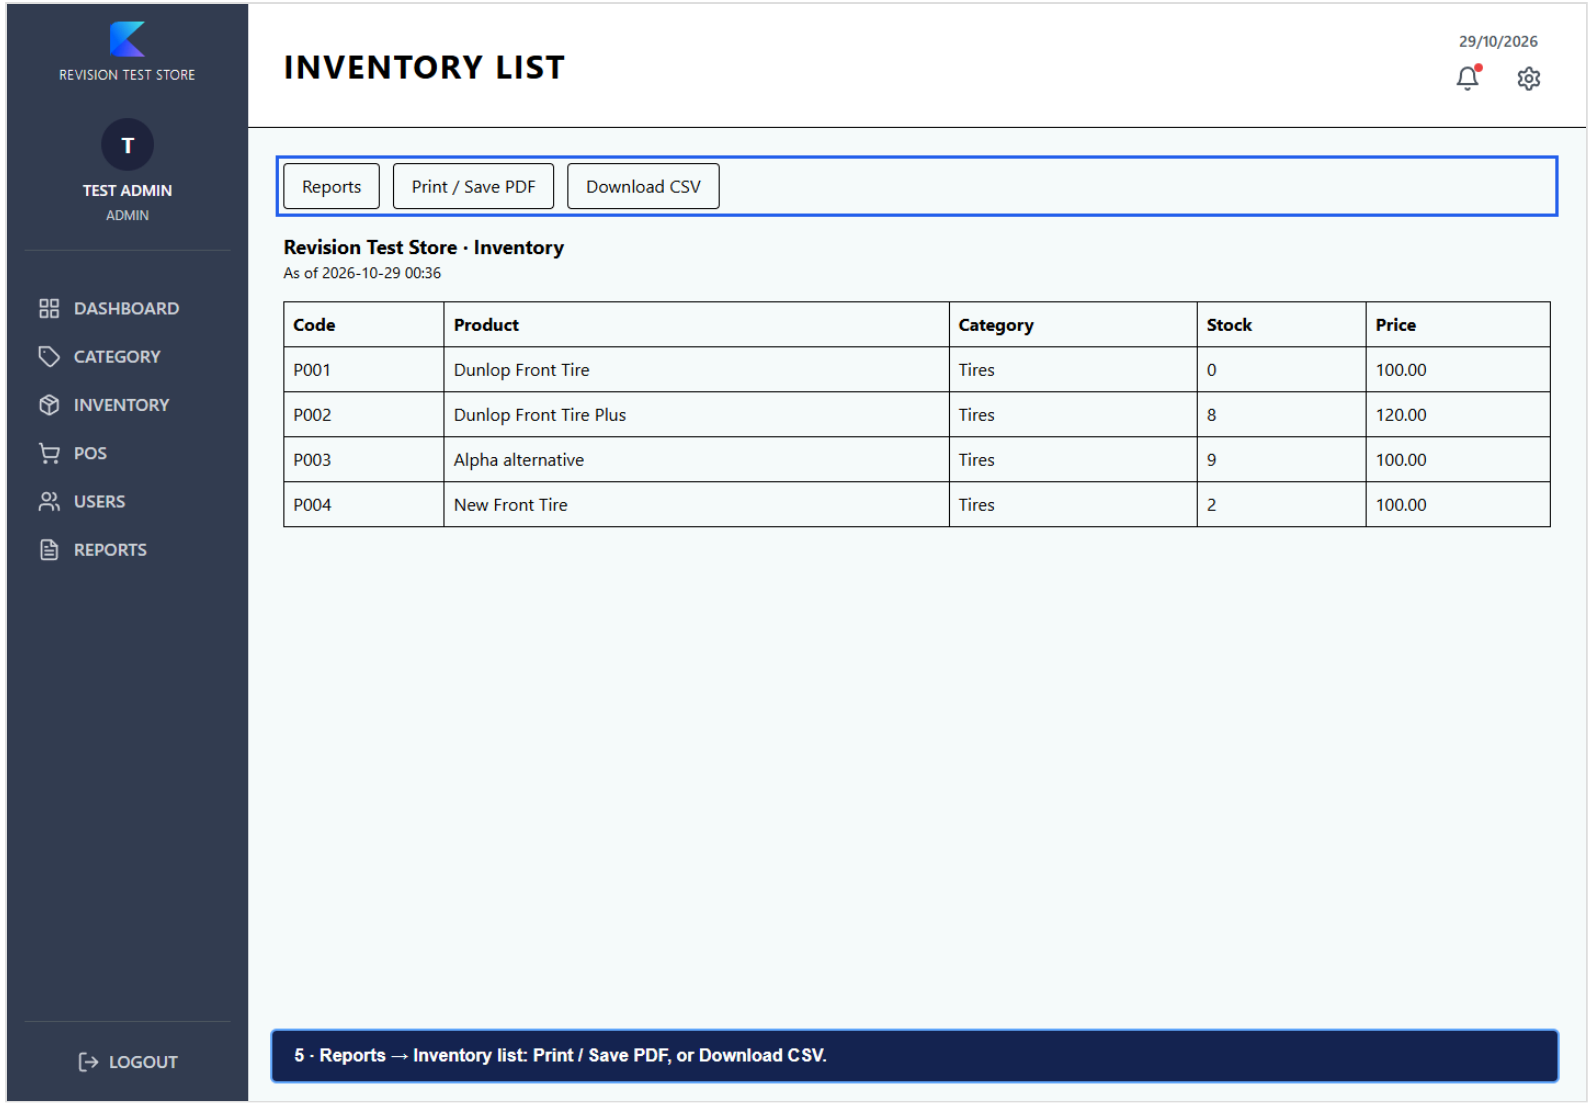

4. Business settings

Open the gear icon, then Business header, logo & product properties. Admins can edit branding and add or rename custom properties. Fill a property on a product when its alternatives must match it.

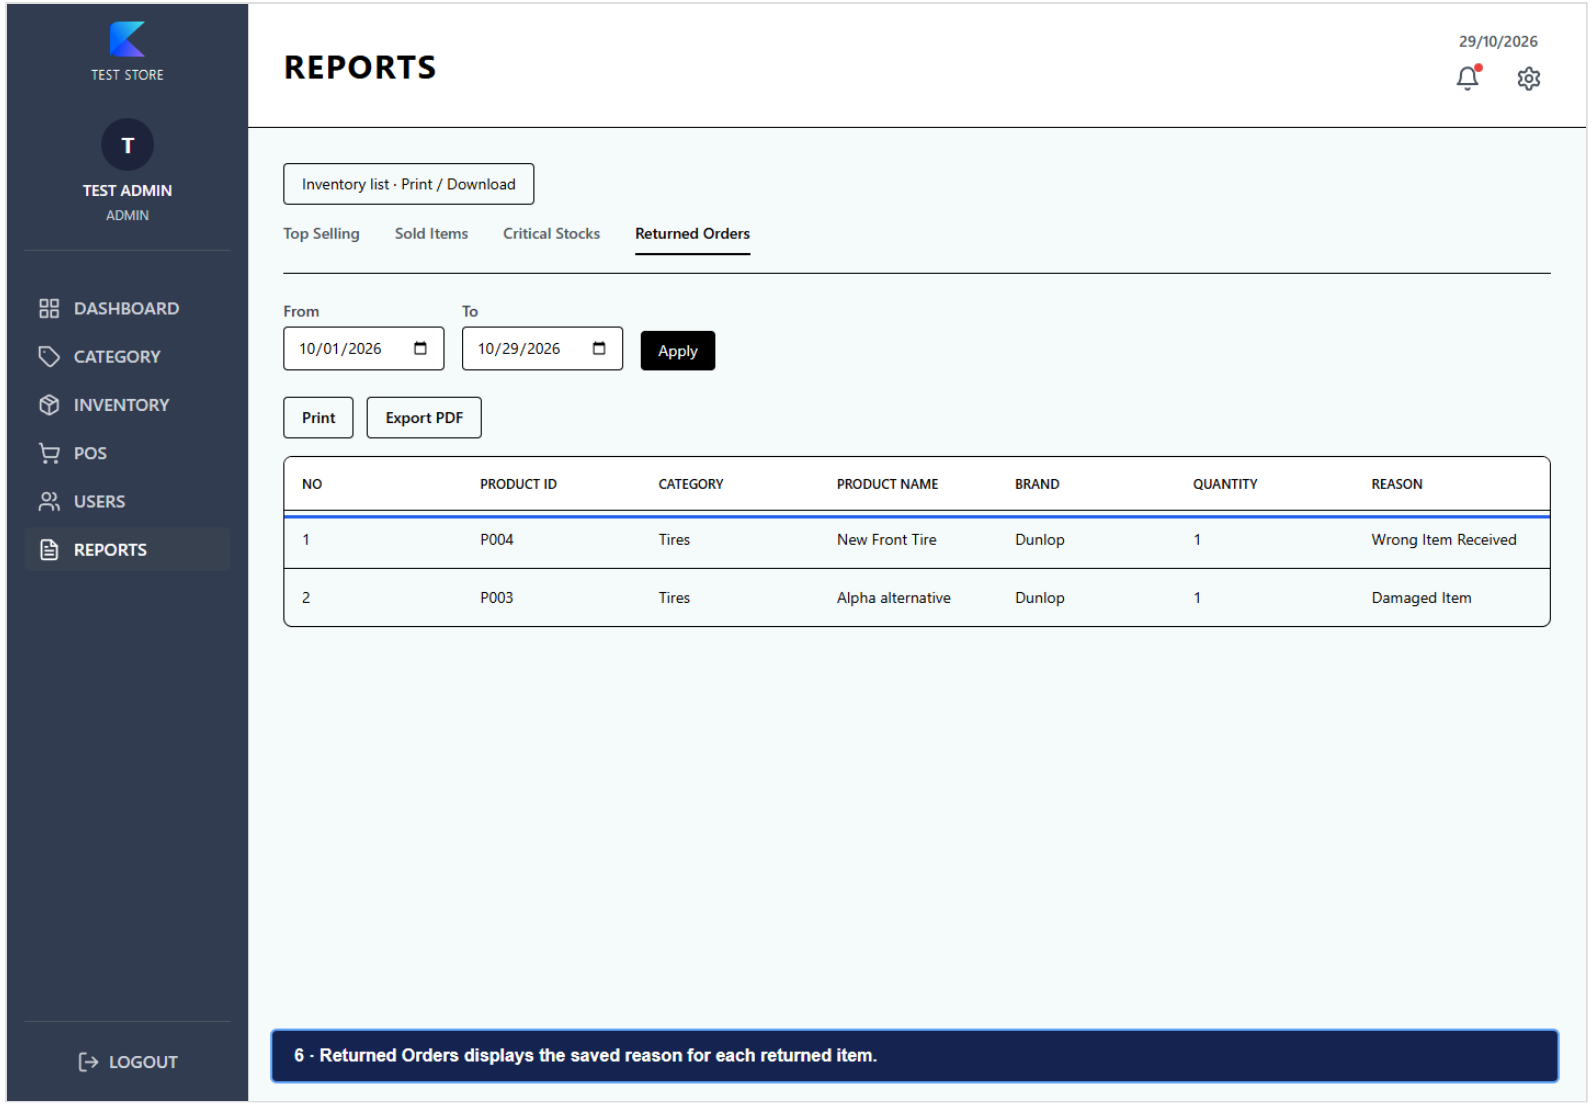

5. Inventory export

Reports → Inventory list. Print or save a PDF through the print dialog, or download CSV.

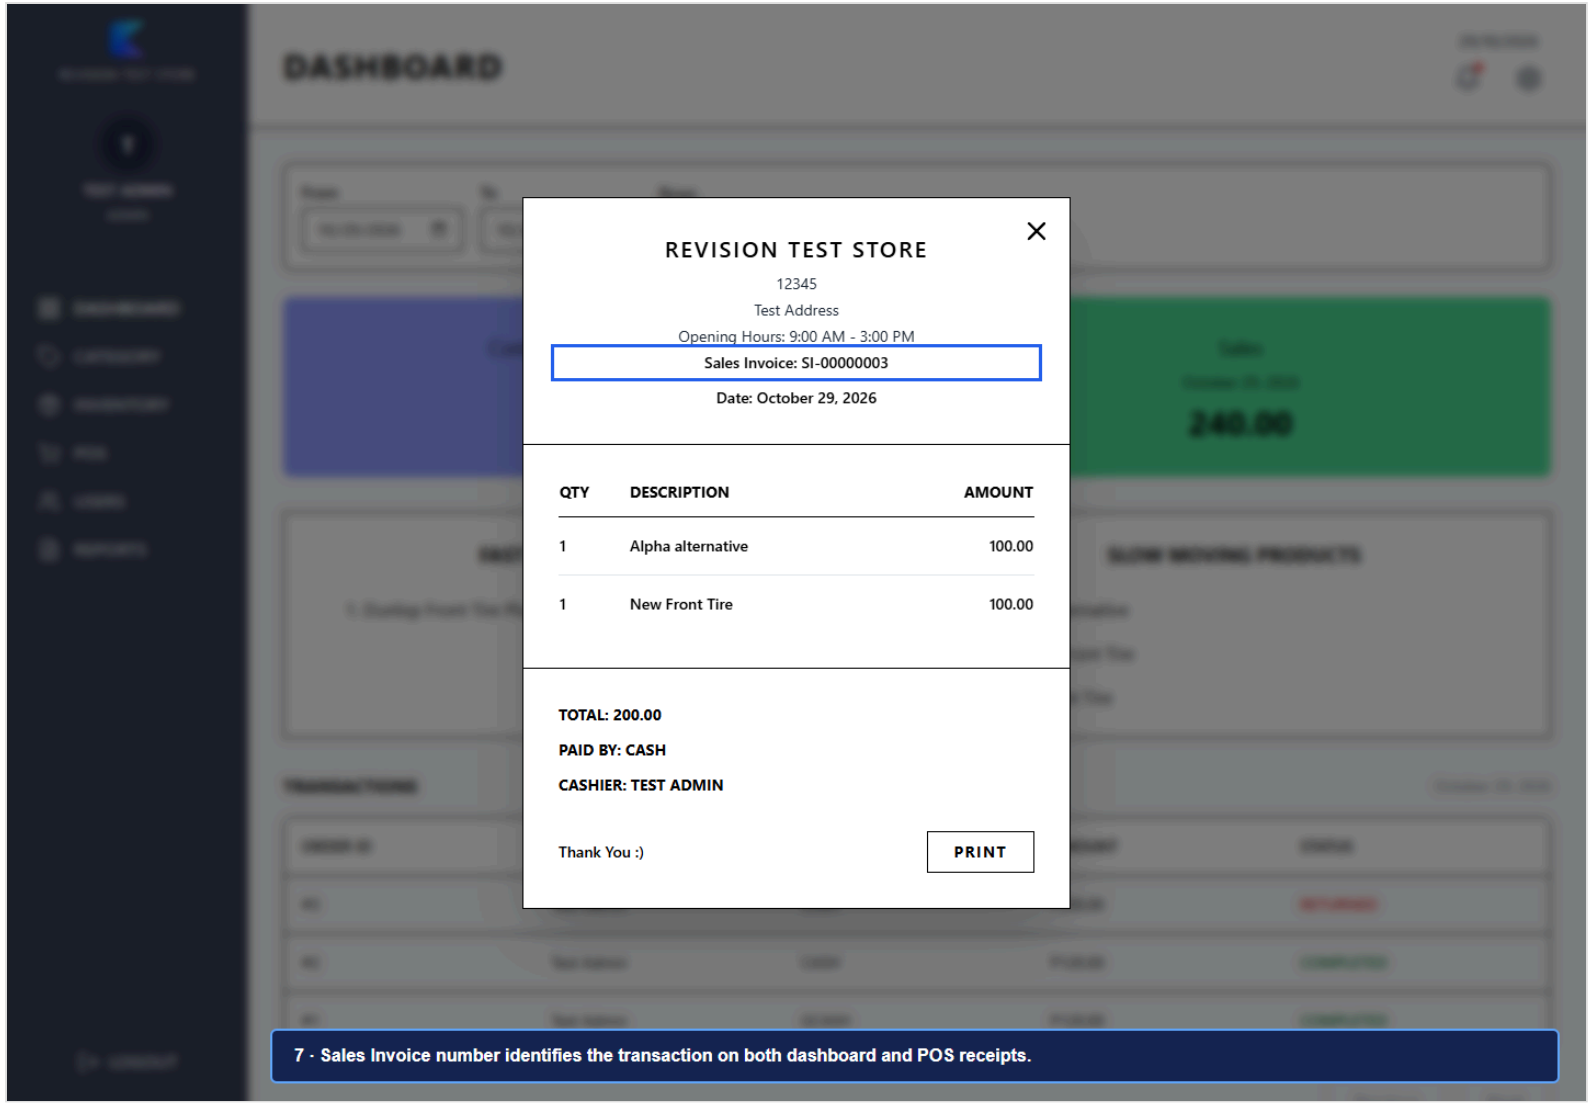

6. Return reasons

Returned Orders shows the saved reason, including items returned from a partially returned sale.

7. Sales invoice

Both POS and dashboard receipts show an SI-prefixed sales invoice number.

8. Selective returns

Open a dashboard receipt and click Return. Select whole product lines, a destination and a reason. Sellable items return to their original batches. Damaged or expired returns must not be restocked.
